

## Supplementary Material

**Table S1** Pairwise comparisons of inter-island genetic differentiation in the louse *Degeeriella regalis*. Data are based on 1099 bp of mtDNA sequences (partial COI and 12S) collected from 110 individual lice from 8 Galápagos hawk island populations. Pairwise  $F_{st}$  values estimated from Kimura 2-parameter genetic distances are below the diagonal and the  $P$  values of those comparisons are above the diagonal.

**Table S2** Pairwise comparisons of inter-island genetic differentiation in the louse *Colpocephalum turbinatum*. Data are based on 950 bp of mtDNA sequences (partial COI and 12S) collected from 127 individual lice from 8 Galápagos hawk island populations. Pairwise  $F_{st}$  values estimated from Kimura 2-parameter genetic distances are below the diagonal and the  $P$  values of those comparisons are above the diagonal.

**Table S3.** Pairwise comparisons of inter-island genetic differentiation in the lousefly *Icosta nigra*. Data are based on 937 bp of mtDNA sequences (partial COI and 12S) collected from 117 individual flies from 7 Galápagos hawk island populations. Pairwise  $F_{st}$  values estimated from Kimura 2-parameter genetic distances are below the diagonal and the  $P$  values of those comparisons are above the diagonal.

**Table S4** Mdiv estimates of the non-equilibrium migration rates ( $N_{\text{eff}}m$  below diagonals) and estimates of the divergence times (above diagonal) between population pairs of *Buteo galapagoensis*, using the variable 911 bp mtDNA dataset (divergence times were standardized by taking the product of  $\theta * t$ , where  $\theta = 2N_{\text{eff}}\mu$ ).

**Table S5** Mdiv estimates of the non-equilibrium migration rates ( $N_{\text{ef}}m$  below diagonals) and estimates of the divergence times (above diagonal) between population pairs of *Degeeriella regalis* (divergence times were standardized by taking the product of  $\theta$  \*  $t$ , where  $\theta = 2N_{\text{ef}}\mu$ ).

**Table S6** Mdiv estimates of the non-equilibrium migration rates ( $N_{\text{ef}}m$  below diagonals) and estimates of the divergence times (above diagonal) between population pairs of *Colpocephalum turbinatum* (divergence times were standardized by taking the product of  $\theta * t$ , where  $\theta = 2N_{\text{ef}}\mu$ ).
