

Additional file 2

Morphological features of *Acanthocheilonema spirocauda* collected from necroptized harbour seals at Sealcentre Pieterburen.

Filariae collected from the heart of necropsied harbour seals were identified to species level by morphological features and compared to the data from Anderson (1959) and Leidenberger and Boström (2008).

Female

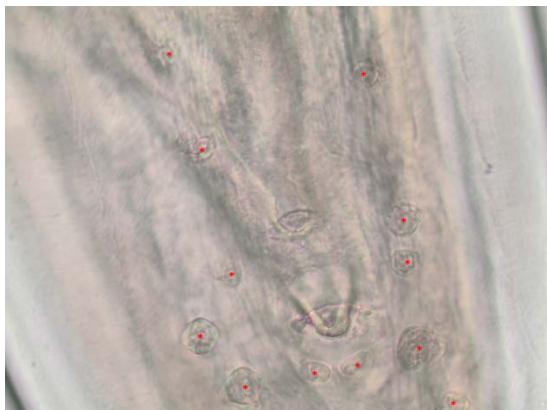

Vulva to anterior end

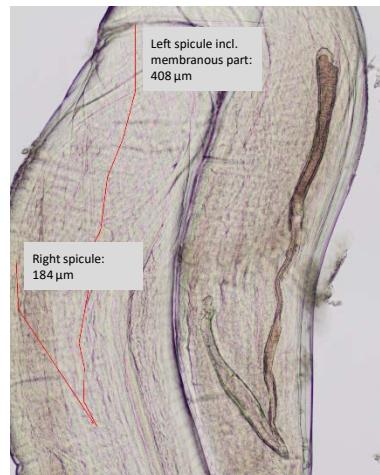

Anus to posterior end

Male

Papillae around the cloacal opening (*):

- One unpaired and three pairs of preanal papillae
- Four papillae in row immediately behind anus, the outer being larger, the inner oval and small
- one unpaired papilla behind the anus

Length of spicules: the left spicule (253 μm) has an extended, chitinized membranous part (sheath).

Length of *Acanthocheilonema spirocauda*

Male: 8.5 – 9.5 cm (mean 9.2 cm, n=3)

Female: 13 – 17.5 cm (mean 15.8 cm, n=6)

Microfilariae from terminal uterus: 186 – 189 μm (mean 188 μm, n=3)
